

More purchases through CashKaro. The same existing users.

Existing users still make eligible purchases without CashKaro. This proposal addresses that original problem by testing a different point of entry.

THE REQUIRED OUTCOME

Valid tracked orders

per quarter

Existing users in the fixed cohort

PROPOSED PRODUCT

CashKaro Connector

Let an assistant hand a selected purchase to CashKaro for an eligible benefit and approved retailer route.

[Original assignment PDF](#)

[Open interactive prototype](#)

Bypass has several causes. Access is the selected hypothesis.

A reminder will not fix an excluded product, an insignificant reward or distrust in payment. The intervention must match the cause.

VALUE

“The benefit is too small.”

TRUST

“Will I receive it?”

ELIGIBILITY

“Does this purchase qualify?”

SELECTED FOCUS / RECALL + RE-ENTRY

“I have decided. Do I need to start again?”

Focus where a meaningful benefit exists but inserting CashKaro adds effort. This is a hypothesis about lost orders, not a measured diagnosis of the entire user base.

The opportunity sits between decision and checkout.

The shopper’s research may happen anywhere. CashKaro needs an actionable handoff, not another research destination.

TODAY’S EXTRA TASK

Remember CashKaro → re-enter → locate the route

PROPOSED HANDOFF

Offer CashKaro here → preserve the selected purchase

Illustrative journey. Exact variant and an eligible pre-cart route are required; existing carts cannot be assumed recoverable.

There is evidence of friction. Its prevalence remains unknown.

AVAILABLE EVIDENCE

1 **inherited respondent**

Retailer-app preference, switching reluctance, small rewards and uncertain payout confidence.

The brief separately establishes bypass among existing users.

NOT ESTABLISHED

- Which cause explains most lost orders
- CashKaro users' AI-shopping overlap
- Demand for this integration
- Incremental order uplift

Next: reconstruct the last three purchases, including routine and non-AI journeys. Diagnose before pitching.

Evidence ledger and limitations · No new interviews or internal telemetry claimed.

Assistants are becoming purchase-decision surfaces.

ALREADY DISTRIBUTED

Google Search

Social

CashKaro does not own every starting point.

EMERGING COMPRESSION

**Need
Research
Recommendation**

**One
conversation**

A purchase handoff becomes strategically valuable.

OpenAI's product-discovery work and Google's Universal Cart support investigating this shift. They do not establish Indian transaction share or reach within CashKaro. Google's announced initial rollout is US-focused.

OpenAI · 24 Mar 2026

Google · 19 May 2026

External purchase routing already has a company precedent.

CashKaro's 2025 Campus Partner listing describes creating cashback links through the Deals Anytime Telegram bot. The proposal extends an existing pattern.

DOCUMENTED PRECEDENT

Product link

Telegram bot

Cashback link

CAPABILITIES TO BUILD ON

Affiliate relationships

Benefit rules + attribution

Account identity + reward settlement

Extend the route. Do not rebuild discovery.

CashKaro Campus Partner listing (2025) · Precedent does not prove reusable APIs, current adoption, AI-host approval or incremental orders.

Start with reachable users, then test the size of the opportunity.

Existing CashKaro transactor

+

Recent AI product research

+

Supported purchase ahead

Estimate this segment through a sampled survey linked, with consent, to pre-period order data. The phone is an interaction example; category selection must consider repeat frequency, eligible coverage and benefit size together.

10%

reachable cohort

×

0.2

extra orders / reachable user

=

0.02

extra orders / assigned user

Illustrative assumptions, not forecast or observed uplift. Broad adoption statistics cannot supply this denominator.

Retain the brief’s problem. Extend its routing directions.

Widget / quick access	Less entry effort; recall remains.	Not the lead
Browser extension	Contextual assistance; browser reach is limited.	Build on principle
Contextual reminders	Incomplete intent signals risk irrelevant prompts.	Not the lead
Share / deep link	Preserves context; remembering to share remains.	Retain foundation
Owned discovery agent	New research habits and costly product data.	Reject ownership

Recommend: CashKaro Connector

Potential recall reduction. Lower deployment control, uncertain reach and partner dependence.

Own-direction extension permitted by the brief. If contextual placement fails, Share may be the better first surface.

The choice stays with the shopper.

01 / CHOOSE

Aster 9

“This is the one.”

02 / CHECK + CONSENT

CASHKARO

₹1,200

estimated Cashback

Pay today **₹39,999**

Potential benefit later **₹1,200**

[Continue with Cashback →](#)

03 / COMPLETE

**Same product.
Same retailer.**

Checkout, payment and fulfillment remain with the retailer.

[Try the interactive prototype →](#)

Fictional product and offer; no instant discount, live integration or transaction. Actual eligibility may differ substantially.

One routing capability. Different entry points.

The assistant recommends. CashKaro checks and routes. The retailer sells.

MCP/API support guarantees neither contextual placement nor affiliate permission. No existing internal API or universal login assumed.

A reliable handoff is the first release.

One reviewed host and two approved merchant paths. Connect an account, check the selected purchase, explain conditions and obtain explicit consent.

CASHBACK

Conditional cash later

The retailer's full price is payable today.

REWARDS

Restricted redemption

Never presented as bank cash.

UNVERIFIED / INELIGIBLE

Continue directly

Preserve the choice; make no benefit claim.

Outside V1: recommendation engine, retailer comparison, checkout, cart repair, scraping and coupon injection.

The prototype includes small/zero benefits, cart warnings, stale policies, prior referrals and route failures.

More CashKaro orders do not prove more retailer sales.

CASHKARO INCREMENTALITY

Did total valid tracked orders increase?

Measure across every CashKaro channel.

Early value may partly be attribution recapture with a visible user benefit. Consent does not override partner rules or justify silently replacing another referral.

RETAILER INCREMENTALITY

Did the retailer gain demand or conversion?

Requires retailer-level evidence.

Route gates: approved source · agreed attribution handling · sustainable retained commission

Monitor reversals and support costs. Affiliate-industry risks and partner dependencies are addressed in the evidence ledger.

Count everyone assigned, including the zeros.

Never connects ✓ Never invoked ✓ Declines ✓ No orders ✓

Intention to treat, with deduplication and a fixed backfill cutoff. AI-routed growth with flat total orders is channel displacement.

Confirmed-order quality, tracking failures and contribution are companion measures. Full protocol linked [here](#).

Fund learning before broad distribution.

Recruit the predefined segment through CashKaro-owned invitations. Host-directory discovery is not a dependable launch plan.

01 / UNDERSTAND

Purchase research + usability

Is re-entry the problem? Is the benefit understood?

03 / MEASURE

Fixed-cohort experiment

Establish reach, power and contribution before scale.

Effort follows an integration assessment. Share remains a separate behavioural test; its success cannot validate the AI thesis.

02 / PROVE

One host + approved routes

Verify placement, context transfer, rules and attribution.

04 / EXPAND

Additional hosts or Share

Only when preceding gates support investment.

Proceed conditionally. Change direction when evidence requires it.

Reach	Too few eligible purchase moments	Placement	Repeated recall erases the advantage
Permission	Partners reject the source or route	Reliability	Context, eligibility or attribution fails
User value	Benefits do not justify interruption	Incrementality	Orders only shift between channels
Economics	Contribution deteriorates	Competition	Hosts offer superior native incentives

The recommendation is a bounded validation investment. I would favour Share if it delivers comparable value with lower effort and better control.
